## **HERBICIDE**

## **NICOSULFURON**

### Selective systemic herbicide

Nicosulfuron is a sulfonylurea herbicide which was originally discovered by ISK. It controls a wide range of weeds covering both annual and perennial species.

Because of its excellent performance, Nicosulfuron has been used by corn growers globally since it was launched in the early 1990's.

#### **Physico-Chemical Properties**

Chemical structure N  $SO_2NHCONH$  N  $OCH_3$   $OCH_3$   $OCH_3$ 

Class: sulfonylurea

IUPAC name : 2-(4,6-dimethoxypyrimidin-2-ylcarbamoyl

sulfamoyl)-N, N-dimethylnicotinamide

Molecular weight: 410.4

Molecular formula: C<sub>15</sub>H<sub>18</sub>N<sub>6</sub>O<sub>6</sub>S

Vapour pressure : <8×10<sup>-7</sup> mPa (25°C) Water solubility : 7.5 g/L (20°C, pH 6.5°C)

Form: White solid, no characteristic odour

Development code: SL-950

#### **Toxicology & Ecotoxicology**

Rat LD<sub>50</sub> (oral) : > 5,000 mg/kg (m/f) Rat LD<sub>50</sub> (dermal) : > 2,000 mg/kg (m/f) Rat LC<sub>50</sub> (inhalation) : 5.47 mg/L (4 h) Skin irritation : non irritant (rabbit)

Eye irritation : non irritant (rabbit)

Skin sensitization : not a sensitizer (guinea pig) Avian  $LD_{50}$  (acute oral) : > 2,000 mg/kg (quail, m/f)

Avian LD<sub>50</sub> (acute oral) : > 2,000 mg/kg (mallard duck, m/f)

Fish LC50 : 65.7 mg/L (trout, 96 h) Fish LC50 : > 100 mg/L (bluegill, 96 h)

Bees  $LD_{50}$  (contact) : 76  $\mu$ g/bee Bees  $LD_{50}$  (oral) : > 22.4  $\mu$ g/bee Daphnia magna  $EC_{50}$  : 90 mg/L (48 h)

#### **Application**

**Uses** Nicosulfuron controls annual grass weeds, broad leaved weeds, and perennial weeds such as *Sorghum halepense* and *Elymus repens* at rates of 30–60 g a.i./ha.

**Phytotoxicity** Nicosulfuron has excellent selectivity to corn. In cases where corn is stressed, nicosulfuron may cause yellowing of corn foliage; however, it is transient and does not affect yield.

#### **Mode of Action**

**Plant Uptake** Nicosulfuron is rapidly absorbed by leaf tissue and is translocated meristems via the phloem and xylem. Nicosulfuron controls weeds by inhibiting acetolactate synthase (ALS), also called acetohydroxy acid synthase (AHAS). ALS is a necessary enzyme for the production of three branched-chain amino acids, isoleucine, leucine, and valine.

**Symptoms** Weeds treated with nicosulfuron will first begin to develop chlorosis in the new growth and then gradually, as the weed continues to be starved of the vital branched-chain amino acids, the chlorosis symptomology will develop in older growth. Chlorotic symptomology then turns to necrosis and desiccation of the plant tissue occurs. Control typically takes 3-4 weeks, from treatment to plant death.

**Selectivity** Nicosulfuron's excellent selectivity to corn is due to the ability of corn to metabolize nicosulfuron into inactive metabolites.

#### **Product**

| Trade Names          | MOTIVEL, NISSHIN, FORNET, SAMSON, SANSON, NICO, 玉农乐, ワンホープ, etc. |  |  |  |  |
|----------------------|--|--|--|--|--|
| Formulations         | 6%OD, 4%SC   |  |  |  |  |
| Registered Countries | tered Countries Asia Japan, China, Korea, Thailand               |  |  |  |  |
|                      | Europe   | Portugal, Spain, Belgium, Czech, France, Greece, Netherland, Poland, Slovakia, Ukraine, Bulgari. Romania, Croatia, Germany, Hungary, Serbia, Slovenia, Austria, etc. |  |  |  |
|                      | Americas   | USA, Brazil, Argentina, etc.   |  |  |  |

# **NICOSULFURON**

Selective systemic herbicide

#### **Visual Effect of Herbicidal Activity**

Untreated Nicosulfuron Treated Plot (30 days after application)

#### **Characterisitics**

ALS inhibitor

Excellent activity at low dosages (30–60 g a.i./ha)

Broad weed spectrum including grasses, broadleaf weeds and sedges

Safe to corn

Safe to birds, fish, bees and other beneficial insects

#### **Weed Spectrum**

|                   |                         |                   | Rate (g a.i./ha) |       |       |
